

FSA for recognizing bit strings containing 0010 as a substring

FSA for recognizing bit strings ending in 0010

FSA for recognizing an identifier

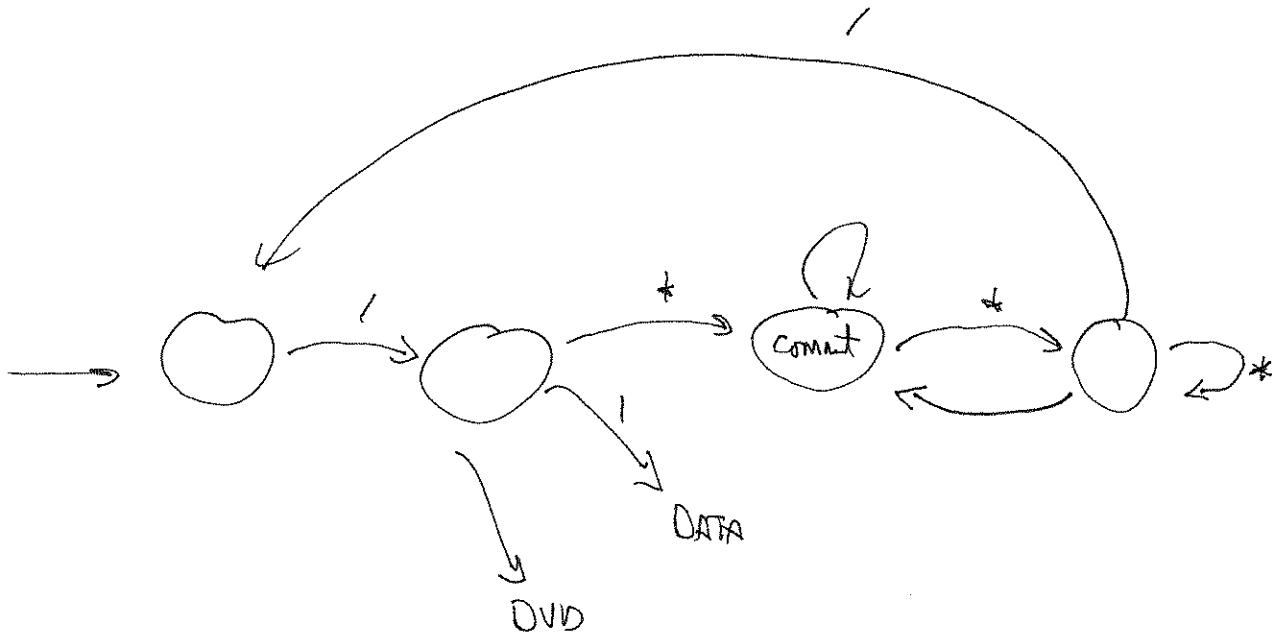

Suppose a language contains the following tokens:

/ DVD // DATA

/+ +/
└─┬─┘
separate
enclose
comments

Here is an FSA that can lead to the portion of the scanner that handles these tokens.

(Note - This scanner would completely ignore comments and would not allow nested comments.)

FSA for discussion language
